Dear Hiring Manager,

I am writing to apply for the Computer Vision Engineer role in Markham that your firm is recruiting for. For 5.5 years at MAS Holdings, South Asia's largest apparel manufacturer, I built and ran computer-vision systems on live production floors, not in a lab: an automated multilingual care-label QC system using OpenCV template and feature matching with an explainable defect overlay, iterated from a handheld scanner to an industrial camera on a conveyor with PLC-controlled reject, cutting inspection time 99.5% while keeping a human-in-the-loop path for borderline cases. This is the same discipline the posting describes: computer vision and pattern-recognition R&D that has to survive contact with an automation line, not just a benchmark.

Against the specific requirements: I have reverse-engineered PLC trigger points and coordinated closed-loop electrical/software subsystems in custom C++ for a direct-to-garment printer integration, and separately designed a geometry-alignment algorithm and built the RIP integration for Promptly, MAS's on-demand printing product now running in four countries, so I am comfortable owning the boundary between vision software and factory hardware. I also built a loom-side fabric-defect detection system using a microscopic camera array that cut operator headcount 50%, and OCR/layout-segmentation pipelines for garment tech-pack digitization. My production C++ work has been on Linux and embedded toolchains rather than Visual Studio on Windows specifically, and I have not done PCB schematic capture in AutoCAD; both are a natural extension of the electrical/software integration work I already do, and I would expect to pick up the Windows-side toolchain quickly. I have also delivered hands-on CV training to engineering teams and represented my group at international trade shows, so customer-facing installation and commissioning work is familiar territory, including the travel that comes with it.

Manufacturing-floor automation is where I have chosen to build my career, from apparel production in Colombo to a PhD adding formal rigor to how I benchmark and validate a system before it goes live. I would bring that same prototype-to-production discipline to your client's automation and computer-vision programs from day one.

I am a Canadian Permanent Resident and do not require sponsorship. I am based in Toronto, a short commute from Markham, and available immediately, including for the periodic travel the role requires. I would welcome the chance to discuss how my industrial computer-vision background can contribute to your client's team.

Sincerely,
Nishal Stanislaus Silva
